

August 30, 2025

Work focused on improving data integrity, with an issue resolved on enquiry duplicate checks to ensure more reliable validation.

August 29, 2025

Development centered around authentication and caching. An authentication service file was added, and a cache plugin was introduced with its package configuration. The cache service plugin was then integrated to store user details across buyers, enquiries, and users tables, streamlining data access and improving performance.

August 28, 2025

User experience enhancements were prioritized. A JSON file was introduced for managing property-map data, search functionality was implemented on the view-history page, and a signup redirect was added in the admin login page to improve user onboarding flow.

August 27, 2025

Work focused on enquiry management, with the enquiry list implemented in the admin UI to provide better visibility and control for administrators.

August 26, 2025

Enhancements were made to the enquiry module and admin tools. An enquiry pop-up was implemented in the UI to simplify interactions, while search functionality in the admin's search history was added to enable faster data tracking and retrieval.

August 25, 2025

The buyer experience was enhanced with the implementation of favorite and unfavorite functionality for properties, allowing users to personalize and manage their preferred listings more effectively.

August 24, 2025

A profile page for agents and builders was introduced, utilizing the existing edit page to maintain consistency while expanding functionality for better profile management.

August 23, 2025

Enhancements were made to agent and builder handling. The entity references were updated from agent/builder to agent_logo/builder_logo in landing UI services. The property component was improved with carousel navigation and conditional sections, alongside stronger validation to prevent duplicate license and phone entries in the edit agent form.

August 22, 2025

The agent module was stabilized by fixing agency name update issues and adding an office type field for builders. A new logo update endpoint was introduced with soft delete and database path management, ensuring smoother logo handling.

August 21, 2025

Major refinements were applied to the agent, builder, and property modules. This included

improved validation, UI adjustments, secure file and document handling, soft delete functionality, and updated endpoints to strengthen reliability across modules.

August 20, 2025

Mobile responsiveness received attention with fixes to image handling and a redesign of the add, edit, and builder pages for smaller screens, ensuring a better mobile user experience.

August 19, 2025

Dashboard insights were improved by restructuring count displays. Validation and API checks for agents and builders were strengthened, while the property add/edit process was enhanced with better icons, image validation, step memory, and improved UI consistency. The index component functionality was also refined for clarity and stability.

August 18, 2025

Validation and usability improvements were delivered. Email duplication checks were introduced for add and edit agent forms, and alignment issues in the search section of the landing UI on mobile were resolved. Additional fixes were applied to the add and edit property pages to eliminate inconsistencies and ensure smoother operation.

August 16, 2025

The user interface was redesigned across property, agent, and builder modules, refreshing the view, add, and edit screens for a more modern and cohesive design.

August 15, 2025

The landing UI homepage was enriched with a search function and a featured property list, improving both discoverability and user engagement.

August 13, 2025

The dashboard was enhanced with several major features. Recent transactions and active users were introduced to give real-time insights. A bar chart was added to provide a clear overview for admins, agents, and builders. Count functions were also implemented, strengthening the analytical capabilities of the dashboard. In addition, database backups and a zipped folder were created to secure data, while the login response structure was refined for better consistency.

August 12, 2025

Significant progress was made on historical data handling. View history was implemented with both search and pagination support, improving traceability. Enhancements also included search history functionality. Supporting updates were added with an image zip folder and database backup to ensure reliable recovery.

August 11, 2025

UI stability was improved with issue resolutions across the add/edit builder page, view property, and add property screens. Backup measures continued with image zips and

database snapshots. A separate backup from August 9th was also added to maintain redundancy.

August 9, 2025

Core stability updates were carried out, resolving issues in the system. Property search was restructured, and transaction type endpoints were improved for clearer functionality. To enhance usability, a proper error message was added on the login screen of the admin UI, ensuring better feedback for users.

August 9, 2025

Work focused on user experience improvements. Proper error messages were added for both sign-up and sign-in processes, making authentication more intuitive. The builder and agent modules were extended with a dedicated list and view page, including image retrieval. Pagination was also introduced in the landing UI, enabling smoother navigation through records. A backup of uploaded images was added to maintain data safety.

August 8, 2025

Enhancements were made across the UI and data management. A backup was created, CSS was removed from the common property section to streamline styling, and pagination issues were fixed. The top bar was updated with a dynamic profile picture, while the user profile module was expanded with pagination and validation fixes for better usability.

August 7, 2025

The system received major functional updates. A backup was added, while CRUD operations for the builder module were implemented, allowing agents and builders to log in and manage records. Additional CRUD functions were introduced for agents, along with builder add and list features. These updates laid the foundation for a more complete multi-role management system.

August 6, 2025

Authentication and property management were improved. The login response was restructured and saved to both local and session storage for consistency across sessions. New endpoints were introduced for amenities, and issues in the add, edit, and view pages for amenities were resolved, making the module more reliable.

August 5, 2025

Work focused on improving property management. Endpoints for add, edit, list, and view property pages were fixed.

August 2, 2025

A backup was added. UI inconsistencies were resolved, and the edit property page issue was fixed. Major redesigns were done for the add, edit, and view property pages.

August 1, 2025

A backup was added. Search functionality was implemented, and the add and edit property screens were redesigned for better usability.
